# Does a 5G base station require three-phase electricity

What is 5G BS power consumption?

The 5G BS power consumption mainly comes from the active antenna unit(AAU) and the base band unit (BBU),which respectively constitute BS dynamic and static power consumption. The AAU power consumption changes positively with the fluctuation of communication traffic,while the BBU power consumption remains basically unchanged ,,,

What is 5G base station?

1. Introduction 5G base station (BS),as an important electrical load,has been growing rapidly in the number and density to cope with the exponential growth of mobile data traffic . It is predicted that by 2025,there will be about 13.1 million BSs in the world,and the BS energy consumption will reach 200 billion kWh .

How does mobile data traffic affect the energy consumption of 5G base stations?

The explosive growth of mobile data traffic has resulted in a significant increase in the energy consumption of 5G base stations (BSs).

What is the difference between 4G and 5G?

According to the principle of mobile communication,the transmission distance and frequency of the signal are inversely proportional when the power ratio of receiving and transmitting is constant. The frequencies of 4G base stations are generally from 2.3GHz to 2.6GHz,and the frequencies of 5G high-frequency base stations are above 28GHz.
