# Prospects of energy storage power station projects

How do pumped storage power stations recover operating costs?

Pumped storage power stations recover the operating costs of pump and generation through the electricity energy tariff. The capacity tariff reflects the value of the auxiliary services provided by the pumped storage power station, such as frequency regulation, voltage regulation, system standby and black start, etc.

How does energy storage affect regional power systems?

While the aforementioned research primarily examines the microeconomic perspective, focusing on the application of specific energy storage (ES) technologies, there is also a body of literature that analyzes the macro-level impact of ES in regional power systems. The assessment of economic system effects often centers around cost reduction.

How many electrochemical storage stations are there in 2022?

In 2022, 194 electrochemical storage stations were put into operation, with a total stored energy of 7.9GWh. These accounted for 60.2% of the total energy stored by stations in operation, a year-on-year increase of 176% (Figure 4).

When will energy storage become a large-scale development?

In March 2022, National Development and Reform Commission (NDRC) and National Energy Administration (NEA) released the 14th Five-Year Plan for the development of energy storage, which set the target for ES to enter the stage of large-scale development by 2025. The target calls for lower costs of ES.
