
Safe distance between base station and power lines

How far away should you be from power lines?

2) STAY BACK: If you are working around power lines, keep a safe distance from the lines. You should be at least ten metres (33 feet) away from the lines and your equipment should be at least six metres (20 feet) away. Use a spotter to make sure you are maintaining this minimum safe distance.

How far should a powerline be from the ground?

For instance, for voltages up to 50 kV, a minimum distance of 10 feet is often recommended. However, as voltage increases, so does the required distance. To effectively implement powerline safe distance guidelines, it is essential to recognize the factors that influence these distances:

How far away should EMF be from power lines?

While EMFs from power lines decrease rapidly with distance, here's a general guideline: 100-200 feet (30-60 meters) is considered a safe buffer for large transmission lines (110kV+). At 300 feet (90 meters), EMF levels are nearly the same as typical household appliances. 4. Safety Rules for Workers

How far from high voltage power lines is safe?

The safe distance from high voltage power lines depends on line voltage, activity type (living vs. working), and local regulations. As a general rule, maintaining at least 100-200 feet from large transmission lines for residential purposes is a good practice, while workers must follow OSHA clearance requirements.
