# Solar power stations can be used as energy storage

Can solar energy be used for energy storage?

Solar power can be used to create new fuels that can be stored and later used to provide energy. Existing compressed air energy storage systems often use the released air as part of a natural gas power cycle to produce electricity.

What is energy storage?

Energy storage is a system that can help more effectively integrate solar into the energy landscape. Sometimes it is co-located with, or placed next to, a solar energy system, and sometimes the storage system stands alone.

Why is solar storage important?

Solar storage is important because it allows solar energy to contribute to the electricity supply even when the sun isn't shining. It also helps smooth out variations in solar energy flow on the grid, which are caused by changes in sunlight.

Can battery storage be used during non-solar hours?

Solar power plants have become a cornerstone of this transition, generating clean, renewable energy. However, solar energy production is inherently intermittent--limited to daylight hours and weather conditions. This is where battery storage systems step in, storing excess energy for use during non-solar hours.
