
The role of solar panel micro inverter

What is a solar panel microinverter?

Unlike centralized string inverters, which are typically responsible for an entire solar panel system, microinverters are installed at the individual solar panel site. Most solar panel systems with microinverters include one microinverter on every panel, but it's not uncommon for one microinverter to connect to a handful of panels.

How do solar microinverters work?

Microinverters are typically installed directly onto each solar panel. This set-up strays away from traditional string inverters that connect multiple solar panels together in series. In practice, each solar microinverter operates independently.

Should you use a microinverter or a central solar inverter?

Suppose that in the future, your energy needs will rise. Instead of matching a central solar inverter's power output to your new system size, you can use microinverters to add more panels. You can expect a longer lifespan because the microinverter guarantee is often for the same time as the connected panels (usually 25 years).

What are microinverters used for?

Specifically, microinverters are employed to optimise the performance of individual panels. These plug-and-play devices are particularly useful in residential solar panel systems. Furthermore, they offer higher production, as they aren't affected by shading or obstructions on a single panel.
