
Thin-film solar module types

What are the different types of thin-film solar panels?

Before comparing the different types of thin-film solar panels against crystalline silicon solar panels (c-Si), it is important to remark that there are two main types, monocrystalline silicon (mono c-Si) and polycrystalline silicon (poly c-Si) solar panels.

What material is used for thin-film solar panels?

Cadmium telluride (CdTe) is the most popular material for manufacturers of thin-film solar panels. Using the EnergySage Marketplace, you can choose from various solar panel installers who can work with different types of thin-film and regular panels. What are thin-film solar panels?

What is the difference between thin-film solar panels and monocrystalline solar panels?

The main difference between thin-film solar panels and other types, such as monocrystalline and polycrystalline, lies in their material composition and structure. Thin-film panels are made with layers of photovoltaic material that are only a few microns thick, resulting in a lightweight, flexible panel.

What is a thin film solar panel?

In terms of structure, a thin film solar module may be monolithic, integrating all components onto a single sheet. This simplifies design and makes installation faster. How Solar Panel Works plays a role here too: like traditional panels, these convert sunlight into electricity using the photovoltaic effect.
